

NCP367

Battery Charge Front-End Protection, USB and AC/DC Supply Compliant

NCP367 is a charge path protection device which allows disconnecting the systems from its output pin in case wrong charging conditions are detected. The system is positive overvoltage protected up to +30 V. Thanks to a very low current consumption, the USB charge is compatible with this integrated component.

This device uses internal PMOS FET, making external devices unnecessary, which reduces the system cost and PCB area of the application board. First, NCP367 is able to instantaneously disconnect the output from the input if the input voltage exceeds the overvoltage threshold. Additional overcurrent protection function allows turning off internal PMOS FET when the charge current exceeds current limit, which is externally selectable.

The current limit value can be modified with control logic pin to divide it by internal gain, allowing USB 100 mA/500 mA charging or USB/Wall adapter charging up to overcurrent threshold. At the same time, Li ion Battery voltage is continuously monitored, providing more safety during the charge. Thermal shutdown protection is also available.

NCP367 provides a negative going flag ($\overline{\text{FLAG}}$) output, which alerts the system that a fault has occurred as overvoltage (power supply or battery voltage), overcurrent or thermal event.

In addition, the device has ESD-protected input (15 kV Air) when bypassed with a 1 μF or larger capacitor.

Features

- Overvoltage Protection Up to + 30 V
- Fast Turn Off Time
- Very Low Current Consumption/USB Compliant
- Li ion Battery Voltage Monitoring
- Overvoltage Lockout (OVLO)
- Undervoltage Lockout (UVLO)
- Overcurrent Protection Externally Adjustable (OCP) up to 2.8 A
- Thermal Shutdown
- Shutdown $\overline{\text{EN}}$ and Gain Input Pins
- Soft-Start to Eliminate Inrush Current
- Alert $\overline{\text{FLAG}}$ Output
- Compliance to IEC61000-4-2 (Level 4)
8 kV (Contact), 15 kV (Air)
- ESD Ratings: Machine Model = B
Human Body Model = 2
- 8 Lead DFN 2.2x2 mm Package
- These are Pb-Free Devices

NCP367

PIN FUNCTION DESCRIPTION

Pin	Name	Type	Description
1	IN	POWER	Input Voltage Pin. This pin is connected to the power supply: Wall Adapter or USB. A 1 μ F low ESR ceramic capacitor, or larger, must be connected between this pin and GND.
2	V _{BAT}	INPUT	Li ion Battery voltage sense pin. A serial resistor must be placed between this pin and positive pin of the battery pack.
3	NC	OUTPUT	Not Connected
4	I _{LIM}	OUTPUT	Current Limit Pin. This pin provides the reference, based on the internal band-gap voltage reference, to limit the overcurrent, across internal PMOSFET, from IN to OUT. A 1% tolerance, or better, resistor shall be used to get the highest accuracy of the Overcurrent Limit.
5	$\overline{\text{EN}}$	INPUT	Enable Mode Pin. The device enters in shutdown mode when this pin is tied to a high level. In this case the output is disconnected from the input. The state of this pin does not have an impact on the fault detection of the FLAG pin.
6	GS	INPUT	Gain Select Pin. When the GS pin is tied to 0 level, the Overcurrent threshold is defined by I _{limit} /GS. See logic table. When GS pin is tied to high, the Overcurrent threshold is set to I _{limit} /GS
7	$\overline{\text{FLAG}}$	OUTPUT	Fault Indication Pin. This pin allows an external system to detect fault condition. The $\overline{\text{FLAG}}$ pin goes low when input voltage is below UVLO threshold, exceeds OVLO threshold, charge current from wall adapter to battery exceeds programmed current limit, Li ion Battery voltage (4.3 V) is exceeded or internal temperature exceeds thermal shutdown limit. Since the $\overline{\text{FLAG}}$ pin is open drain functionality, an external pull-up resistor to V _{Battery} must be added (10 k Ω minimum value).
8	GND	POWER	Ground.
9	OUT	OUTPUT	Output Voltage Pin. This pin follows IN pin when "no input fault" is detected. The output is disconnected from the Vin power supply when voltage, current or thermal fault events are detected. A 1 μ F low ESR ceramic capacitor, or larger, must be connected between this pin and GND.

NOTE: Pin out provided for concept purpose only and might change in the final product

MAXIMUM RATINGS

Rating	Symbol	Value	Unit
Minimum Voltage (IN to GND)	V _{min_{in}}	-0.3	V
Minimum Voltage (All others to GND)	V _{min}	-0.3	V
Maximum Voltage (IN to GND)	V _{max_{in}}	30	V
Maximum Voltage (All others to GND)	V _{max}	7.0	V
Maximum DC Current from Vin to Vout (PMOS)	I _{max}	3.4	A
Thermal Resistance, Junction-to-Air (without PCB area)	R _{θJA}	190	$^{\circ}$ C/W
Operating Ambient Temperature Range	T _A	-40 to +85	$^{\circ}$ C
Storage Temperature Range	T _{stg}	-65 to +150	$^{\circ}$ C
Junction Operating Temperature	T _J	150	$^{\circ}$ C
ESD Withstand Voltage (IEC 61000-4-2) Human Body Model (HBM), Model = 2 (Note 1) Machine Model (MM) Model = B (Note 2)	V _{esd}	15 Air, 8.0 Contact 2000 200	kV V V
Latchup	LU	Class 1	-
Moisture Sensitivity	MSL	Level 1	-

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

- Human Body Model, 100 pF discharged through a 1.5 k Ω resistor following specification JESD22/A114.
- Machine Model, 200 pF discharged through all pins following specification JESD22/A115.

APPLICATION INFORMATION

Operation

The NCP367 is an integrated IC which offers a complete protection of the portable devices during the Li ion battery charge.

First, the input pin is protected up to +30 V, protecting the down stream system (charger, transceiver, system...) against the power supply transients such as inrush current or defective functionality. Additional protection level is offered with the overcurrent block which eliminates current peak or opens the charge path if an overcurrent default appears.

More of that, the battery voltage is monitored all along the input power supply is connected, allowing to open charge path if Li ion battery voltage exceeds 4.3 V, caused by CCCV charger or battery pack fault.

The integrated pass element (PMOS FET) is sized to support very high charge DC current up to 2.3 A. The overcurrent threshold can be externally adjusted with a pull-down resistor and gain select pin is available to divide current limit threshold with internal fixed gain. Allowing to adjust with logic pin the overcurrent threshold if USB/500 mA or WA/1.5 A is detected, without changing R_{ILIM} resistor, in example.

Undervoltage, Overvoltage, Overcurrent and thermal faults are signalized thanks to the open drain FLAG pin, by pulling its down.

Undervoltage Lockout (UVLO)

To ensure proper operation under any conditions, the device has a built-in undervoltage lock out (UVLO) circuit. During V_{in} positive going slope, the output remains disconnected from input until V_{in} voltage is above 1.85 V plus hysteresis nominal. This circuit has a 80 mV hysteresis to provide noise immunity to transient condition.

Overvoltage Lockout (OVLO)

To protect connected systems on V_{out} pin from overvoltage, the device has a built-in overvoltage lock out (OVLO) circuit. During overvoltage condition, the output remains disabled as long as the input voltage exceeds this threshold.

\overline{FLAG} output is tied to low as long as V_{in} is higher than OVLO. This circuit has a 100 mV hysteresis to provide noise immunity to transient conditions.

FLAG Output

NCP367 provides a \overline{FLAG} output, which alerts external systems that a fault has occurred.

This pin is tied to low as soon as the OVLO, OV_{BAT} , I_{OCP} or internal temperature thresholds are exceeded and remains low until between minimum driving voltage and UVLO threshold. When V_{in} level recovers normal condition, \overline{FLAG} is held high. The pin is an open drain output, thus a pull up resistor (typically 1 M Ω – Minimum 10 k Ω) must be provided to V_{CC} . \overline{FLAG} pin is an open drain output, which is able to support 1 mA maximum.

 \overline{EN} Input

To enable normal operation, the \overline{EN} pin shall be forced to low or connected to ground. A high level on the pin, disconnects OUT pin from IN pin. \overline{EN} does not overdrive a UVLO or OVLO fault.

Overcurrent Protection (OCP)

This device integrates the overcurrent protection function, from wall adapter to battery. That means the current across the internal PMOS is regulated and cut when the value, set by external RSEL resistor, exceeds I_{LIM} longer than t_{REG} .

An internal resistor is placed in series with the pin allowing to have a maximum OCP value when I_{LIM} pin is directly connected to GND.

By adding external resistors in series with I_{LIM} and GND, the OCP value is decreased.

An additional logic pin, \overline{GS} (gain select), is very useful in case of different charge rate is necessary (Wall adapter and USB, for example).

By setting \overline{GS} to 0.4 V, overcurrent thresholds are depending on R select resistor, which is connect between pin 4 and GND. When the \overline{GS} pin is tied to 1.2 V (high logic level) the preselected current limit is divided by 2.75. Due

to this option, both fast charge or USB charge are authorized with the same device.

Figure 12. I_{OCP} versus R_{LIM} , GS = low and high, 1.5 A version

Figure 13. Over Current Threshold versus R_{LIMIT} 2.85 A Version

Typical R_{LIM} calculation is following:
NCP367DxMUxxTBG

$$R_{LIM} (k\Omega) = 249 / I_{OCP} - 165$$

NCP367OxMUxxTBG

$$R_{LIM} (k\Omega) = 532 / I_{OCP} - 180$$

During overcurrent event, charge area is opened and \overline{FLAG} output is tied to low, allowing the μ Controller to take into account the fault event and then open the charge path.

At power up (accessory is plugged on input pins), the current is limited up to I_{LIM} during 1.8 ms (typical), to allow capacitor charge and limit inrush current. If the I_{LIM} threshold is exceeded over 1.8 ms, the device enter in OCP burst mode until the overcurrent event disappears.

V_{BAT} Sense

The connection of the V_{BAT} pin to the positive connection of the Li ion battery pack allows preventing overvoltage transient, greater than 4.35 V. In case of wrong charger conditions, the PMOS is then opened, eliminating Battery pack over voltage which could create safety issues and temperature increasing.

The 4.35 V comparator has a 150 mV built-in hysteresis.

More of that, deglitch function of 2 ms is integrated to prevent voltage transients on the Battery voltage. If the battery over voltage condition exceeds deglitch time, the charge path is opened and \overline{FLAG} pin is tied to low level until the V_{BAT} is greater than 4.35 V – hysteresis.

At wall adapter insertion, and if the battery is fully charged, V_{bat} comparator stays locked until battery needs to be recharged (4.2 V typ – 4.1 V min).

A serial resistor has to be placed in series with Vbat pin and battery connection, with a 200 k Ω recommended value.

PCB Recommendations

The NCP367 integrates low $R_{DS(on)}$ PMOS FET, nevertheless PCB layout rules must be respected to properly evacuate the heat out of the silicon. The DFN PAD1 corresponds to the PMOS drain so must be connected to OUT plane to increase the heat transfer. Of course, in any case, this pad shall be not connected to any other potential.

Following figure shows package thermal resistance of a DFN 2.2x2 mm.

NCP367

Figure 14.

Internal PMOS FET

NCP367 includes an internal PMOS FET to protect the systems, connected on OUT pin, from positive over-voltage. Regarding electrical characteristics, the $R_{DS(on)}$, during normal operation, will create low losses on V_{out} pin versus V_{in} , due to very low $R_{DS(on)}$.

Figure 15. Typical $R_{DS(on)}$ versus Temperature

ESD Tests

NCP367 fully support the IEC61000-4-2, level 4 (Input pin, 1 μ F mounted on board). That means, in Air condition, V_{in} has ± 15 kV ESD protected input. In Contact condition, V_{in} has ± 8 kV ESD protected input. Please refer to Figure 16 to see the IEC 61000-4-2 electrostatic discharge waveform.

SELECTION GUIDE

The NCP367 can be available in several undervoltage and overvoltage thresholds versions. Part number is designated as follows:

NCP367xxMUxxTBG

Code	Contents
a	Overcurrent threshold a = D: 1.51 A a = O: 2.85 A
b	V _{BAT} Voltage b: P = 4.36 V (additional thresholds available for a wide Lithium ion material range)
c	UVLO Typical Threshold c: E = 1.85 V
d	OVLO Typical Threshold (Additional thresholds available) d: C = 5.85 V d: E = 6.07 V d: L = 6.85 V d: O = 7.20 V d: A = 3.80 V d: B = 4.54 V

MECHANICAL CASE OUTLINE

PACKAGE DIMENSIONS

ON Semiconductor®

SCALE 4:1

DFN8, 2.0x2.2, 0.5P
CASE 506BP-01
ISSUE A

DATE 13 JAN 2010

DETAIL A
ALTERNATE TERMINAL
CONSTRUCTIONS

DETAIL B
ALTERNATE
CONSTRUCTIONS

NOTES:

1. DIMENSIONING AND TOLERANCING PER ASME Y14.5M, 1994.
2. CONTROLLING DIMENSION: MILLIMETERS.
3. DIMENSION b APPLIES TO PLATED TERMINAL AND IS MEASURED BETWEEN 0.15 AND 0.30 mm FROM TERMINAL.
4. COPLANARITY APPLIES TO THE EXPOSED PAD AS WELL AS THE TERMINALS.

DIM	MILLIMETERS		
	MIN	TYP	MAX
A	0.80	---	1.00
A1	0.00	---	0.05
A3	0.20 REF		
b	0.20	---	0.30
D	2.00 BSC		
D2	1.43	---	1.53
E	2.20 BSC		
E2	1.05	---	1.25
e	0.50 BSC		
K	0.20	0.22	0.30
L	0.25	---	0.35
L1	---	---	0.15

GENERIC MARKING DIAGRAM*

- XX = Specific Device Code
- M = Date Code
- = Pb-Free Device

*This information is generic. Please refer to device data sheet for actual part marking.
Pb-Free indicator, "G" or microdot "■", may or may not be present.

SOLDERING FOOTPRINT*

*For additional information on our Pb-Free strategy and soldering details, please download the ON Semiconductor Soldering and Mounting Techniques Reference Manual, SOLDERRM/D.

DOCUMENT NUMBER:	98AON38697E	Electronic versions are uncontrolled except when accessed directly from the Document Repository. Printed versions are uncontrolled except when stamped "CONTROLLED COPY" in red.
DESCRIPTION:	DFN8, 2.0X2.2, 0.5P	PAGE 1 OF 1

ON Semiconductor and  are trademarks of Semiconductor Components Industries, LLC dba ON Semiconductor or its subsidiaries in the United States and/or other countries. ON Semiconductor owns the rights to a number of patents, trademarks, copyrights, trade secrets, and other intellectual property. A listing of ON Semiconductor's product/patent coverage may be accessed at www.onsemi.com/site/pdf/Patent-Marking.pdf. ON Semiconductor reserves the right to make changes without further notice to any products herein. ON Semiconductor makes no warranty, representation or guarantee regarding the suitability of its products for any particular purpose, nor does ON Semiconductor assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation special, consequential or incidental damages. Buyer is responsible for its products and applications using ON Semiconductor products, including compliance with all laws, regulations and safety requirements or standards, regardless of any support or applications information provided by ON Semiconductor. "Typical" parameters which may be provided in ON Semiconductor data sheets and/or specifications can and do vary in different applications and actual performance may vary over time. All operating parameters, including "Typicals" must be validated for each customer application by customer's technical experts. ON Semiconductor does not convey any license under its patent rights nor the rights of others. ON Semiconductor products are not designed, intended, or authorized for use as a critical component in life support systems or any FDA Class 3 medical devices or medical devices with a same or similar classification in a foreign jurisdiction or any devices intended for implantation in the human body. Should Buyer purchase or use ON Semiconductor products for any such unintended or unauthorized application, Buyer shall indemnify and hold ON Semiconductor and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that ON Semiconductor was negligent regarding the design or manufacture of the part. ON Semiconductor is an Equal Opportunity/Affirmative Action Employer. This literature is subject to all applicable copyright laws and is not for resale in any manner.
